

Canonical Frontend Registry

Web extension + Sepolia contract which are used to verify that frontends at a particular ENS domain are legit / not compromised.

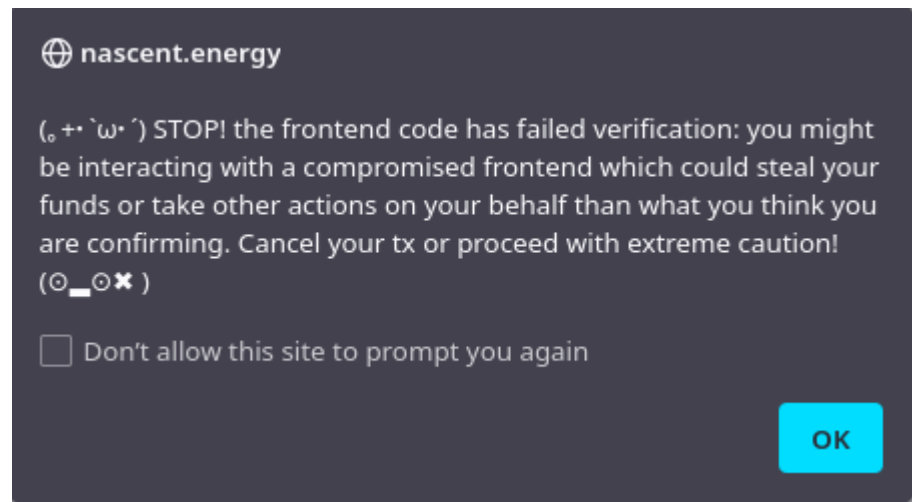

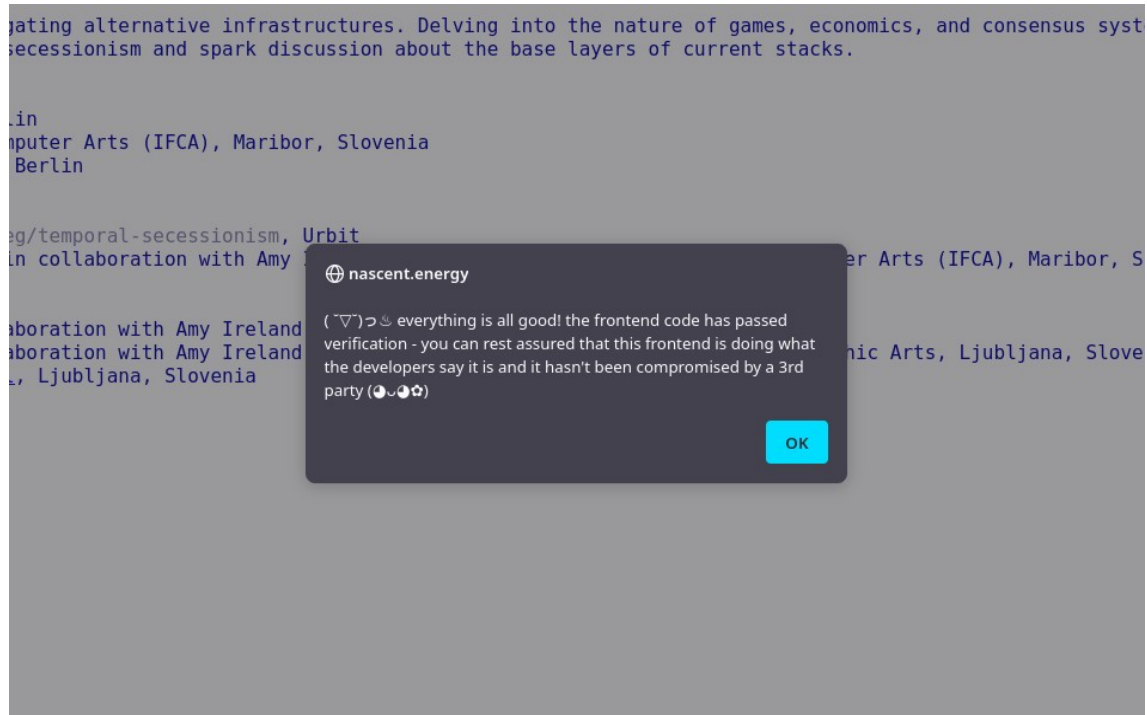

Developers can attest that they own the ENS domain of a particular web frontend and then can upload the hashes of their most recent frontend builds to a contract .

When someone goes to the frontend, the web extension will get each file as it is pulled down by the index.html and hash it, checking against the information in the contract.

:)
